                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAR31575;
                                                                             but were constructed using different strategies (see AAQ36498). The constructs comprise exons 2-7 of human CYP1A1 gene under the control of the inducible mouse metallothionein (MMT-1) promoter. The constructs also contain an open reading frame in the opposite orientation to the cytochrome P450 exons. This ORF encodes ampicillin resistance. The constructs are suitable for transformation of human fibroblasts derived from the xeroderma pigmentosum group A. Cultures of the transformed fibroblasts can be used to test substances for mutagenicity. The presence of the inducible cytochrome P450 gene allows metabolism of the substance to mutagenic metabolites. (Updated on 10-MAR-2003 to add missing OS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            27-JUN-1991;
                                                                                                                                                                                                                                                                                                                                                 The expression constructs pRNH127 and pRNH155 contain identical sequences but were constructed using different strategies (see AAQ36498). The present sequence is encoded by a chimeric mouse metallothionein-cytochrome P450IA1 (CYPIA1) expression construct. Two clones, pRNH127 and pRNH15, were isolated by different methods and which both had the same sequence. The CYPIA1 construct is used in assays to test for cytotoxicity of humans to a chemical. The method comprises exposing human fibroblast cells normally not including any cytochrome P450 activity to potentially toxic chemicals. The cells having been transformed to express cytochrome P450, under the control of a controllable promoter through the CYPIA1 gene, upon exposure to the chemical in vitro. The chemical is metabolised
                                                                                                                                       Testing chemicals for cytotoxicity to human by using recombinant fibroblasts transformed with control of inducible promoter.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0;
```

Escherichia coli beta-lactamase (AAW16639 is the expression product of a molecular (AAT66738), in which the beta-lactamase content intermediate/early promoter. Vectors content

e (AAW16635), Lac...
e molecular chimaera, des...
ractamase gene is under c

y the signal peptide, designated pCMV-delBL ler control of the CMV a transcriptional

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The secreted form (AAW18679) of TEM beta-lactamase is expressed (AAT70309) in which a PCR-amplified beta-lactamase coding placed under control of the intermediate/early promoter of cytomegalovirus. Secretory beta-lactamase constructs, place control of promoter/enhancer elements of lung-associated neuroendocrine marker protein genes, can be used in novel molecules for use in prodrug therapy of lung cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel tetracycline assay that uses recombinant prokaryotic cells comprising a luciferase gene under the transcriptional control of a tetracycline repressor and tetracycline promoter and control of a tetracycline repressor and tetracycline promoter and converse the detection of luminescence emitted form the cells. The assay can be used to distinguish tetracycline form other microbial agents. The convention also describes a novel plasmid comprising either the luxCDABE genes, a tetracycline repressor (TetR) and a tetracycline promoter (TetA) from Tn10. The tetracycline assay convention at the tetracycline assay to study the dosage and penetration of the medicine. The method can also be used to test cheese production, as cheese making bacteria are not also be used to test cheese production, as cheese making bacteria are not determine the presence of tetracycline. The method can also be used to determine the presence or concentration of antibiotics in foodstuffs, c.g. for allergic people. The present assay method does not rely on the present assay is also more sensitive, as even a small amount of liminescence can be also more sensitive, as even a small amount of antibiotics.

This invention describes a novel method for the selection of monoclonal call antibodies (MAD) which comprises (i) fusing B lymphocytes with myeloma cells to produce antibody-producing hybridomas such that the antibodies are presented at the surface of the hybridomas by an antibody-binding CC protein (I); and (ii) binding the antibody to antigens (Ag). The cinvention also describes antibody-binding proteins (I) that comprise a combination of the signal peptide of a murine immunoglobulin (Ig) kappa chain or a murine MHC (major histocompatibility complex) Class I k(k) cc molecule; an antibody-binding site of proteins A, G, L or LG, and the transmembrane domain of PDGFR (platelet-derived growth factor receptor) or CD52. The method is used to select MAD with specificity for particular antigens. MAD can be selected without separate culture of hybridomas, and selection can be made against many antigens in a library, optionally on the basis of strength of affinity for a particular antigen. Complex constitutes of hybridomas can be used for selection, reducing the time and cost involved in MAD selection. This sequence represents the bla protein contained in the expression vector pSEX15G2 which contains the CC bla protein, Neo-R and protein G described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 16; Fig 3; 22pp; German

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel method for the selection of monoclonal collisions (MAb) which comprises (i) fusing B lymphocytes with myeloma colls to produce antibody-producing hybridomas such that the antibodies are presented at the surface of the hybridomas by an antibody-binding CC protein (I); and (ii) binding the antibody to antigens (Ag). The combination also describes antibody-binding proteins (I) that comprise a combination of the signal peptide of a murine immunoglobulin (Ig) kappa chain or a murine MHC (major histocompatibility complex) Class I k(k) concleule; an antibody-binding site of proteins A, G, L or LG, and the transmembrane domain of PDGFR (platelet-derived growth factor receptor) or CD52. The method is used to select MAb with specificity for particular antigens. MAb can be made against many antigens in a library, optionally on the basis of strength of affinity for a particular antigen. Complex cost involved in MAb selection.                                                                                                                                                                                                                                                                    8
                                                                                                                                                                                                                                                                                                                 맑
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel method for the selection of monoclonal antibodies (MAb) which comprises (i) fusing B lymphocytes with myeloma cells to produce antibody-producing hybridomas such that the antibodies are presented at the surface of the hybridomas by an antibody-binding comprise (I); and (ii) binding the antibody to antigens (Ag). The combination of the signal peptide of a murine immunoglobulin (Ig) kappa chain or a murine MHC (major histocompatibility complex) Class I k(k) chain or a murine of PDGFR (platelet-derived growth factor receptor) concluse; an antibody-binding site of proteins A, G, L or LG, and the cross of the method is used to select MAb with specificity for particular antigens. MAb can be selected without separate culture of hybridomas, and contained in the expression vector pSEXIIG2 which contains the protein contained in the expression vector pSEXIIG2 which contains the invention contains the invention of the inve

The host cell also contains a second heterologous polynucleotide encoding a secretory polypeptide to facilitate the secretion of the expressed polysaccharase. The recombinant host cell is useful for producing polysaccharase which is useful for enzymatically degrading oligosaccharides such as lignocellulose, hemicellulose, cellulose, pectin or their combinations, and fermenting the product to ethanol, by simultaneous saccharification and fermentation processes. The present sequence is encoded by an integration vector which was introduced into cells to generate recombinant host cells. The vector contains a surrogate promoter from Zymomonas mobilis, the celZ gene from Erwinia chrysanthemi, resistance markers bla and tet, and Klebsiella oxytoca
                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Recombinant host cells useful for producing polysaccharase for oligosaccharides, comprises a first heterologous polynucleotide polysaccharase under control of surrogate promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Disclosure; Page 82-83; 87pp;

                                                                                                                                                                           The specification describes a method for assessing the growth rate and death rate of a micro-organism within a predetermined time period in a desired environment. The method comprises introducing at least two reporter genes encoding luminescent and/or fluorescent products into the micro-organisms, incubating the micro-organism within the desired environment, and detecting luminescence and/or fluorescence after a predetermined time period. Use of two different markers within a micro-organism enables the differentiation between growth and death rates. The method is used to assess the growth rate and death rate of a micro-organism within a predetermined time period in a desired environment. The present sequence represents a beta-lactamate protein, and is encoded by a plasmid which encodes luminescent and fluorescent proteins, and is used in the method of the invention
                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Assessing growth and death rates of a micro-organism in a deenvironment, by introducing 2 reporter genes encoding lumine fluorescent products and detecting luminescent fluorescence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Disclosure; Page 28-29; 32pp;
